Introduction to the Yangtze Cetaceans

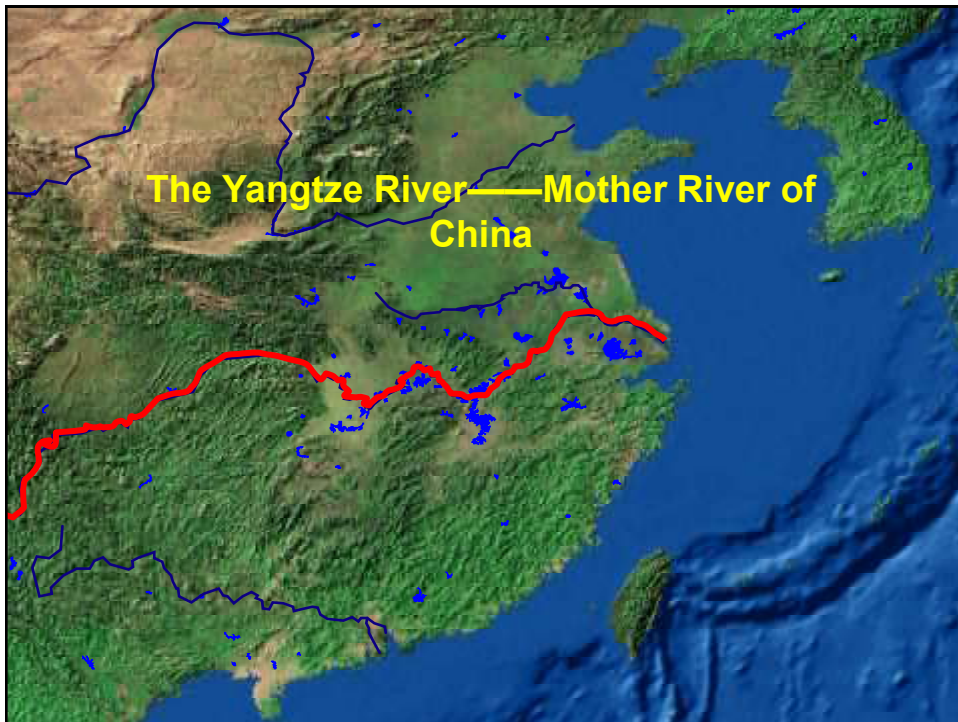

- ◆ China was the one of eight richest biodiversity areas of world (McNeely, 1990).
- ◆ But it was also one of the most biodiversity damaged areas (Liao, 1998).

Last hope for river dolphins

The world's most critically endangered cetacean, the Chinese 'baiji' river dolphin, may finally have a chance of being saved from extinction. But it could be too late: researchers who carried out a nine-day pilot search for the dolphins last month didn't find a single one. The freshwater baiji (*Lipotes vexillifer*) once thrived in their only habitat, the Yangtze River, which runs through central China. But fewer than 100 dolphins are

thought to be left in the river, which has become a busy, polluted highway. "If the giant pandas in China's symbol of the destruction of forests, the baiji stands for polluted waters," says Wang Ding, from the Wuhan Institute of Hydrobiology. An international team of scientists, led by Ding, is hoping to catch the animals and release them in a safer place, possibly the Shishou reserve, which is a 20-kilometre arm off the Yangtze.

Introduction to the Yangtze Cetaceans

- ◆ Yangtze finless porpoise is the only freshwater subspecies of *Neophocaena*.
- ◆ Struggle with all of the threats as Baiji.
- ◆ Only 1800 in 2006.
- ◆ Critically endangered.

Population decline of the finless porpoise in the Yangtze River

Questions & Ideas

Questions by the publics

- ◆ 1800, How less?
- ◆ What's the future? (Trends)
- ◆ What should we do?

Questions by the scientists

- ◆ Status on the IUCN Red list?
- ◆ Main threats?
- ◆ Why so quickly?

Q1: Trends?

- **PROXIMAL**: explaining/describing proximal observations based on **structured data** (ex. N estimates)
- **ULTIMATE**: predicting ultimate results, **trends** in evolution and ecology (TREE), usually based on very **limited data** (ex. Projecting trends)
- Generally: **PROXIMAL** → **ULTIMATE**

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q1: Trends?

➤ Data collection

- ✓ IHB collected the death porpoises ever since 1978
- ✓ Body length, age, sex, date, location, etc.
- ✓ 279 samples

➤ Modeling

- ✓ 1993
- ✓ Life tables (Krebs, 1989)
- ✓ Individual-based Leslie matrix model

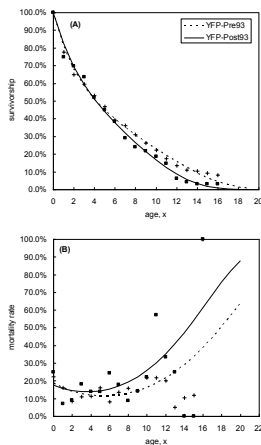

(Mei et al. Biol Cons, 2012)

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q1: Trends?

➤ Comparative study on life tables

➤ Before 1993

$$r = -0.0149 \text{ (SD=0.0144)}$$

➤ After 1993

$$r = -0.0637 \text{ (SD=0.0525)}$$

Accelerated decline

(Mei et al. Biol Cons, 2012)

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q1: Trends?

- $PE_{100} = 86.06\%$, $TE = 61.8$ (SD = 22.4 years)
- $DN_{3T0} > 80\%$
- Next 15 years
- NT → VU → EN → **CR** → EX

(Mei et al. Biol Cons, 2012)

物研究所 鲸类保护生物学学科组

Q2: What affect?

Comparative research on
populations

✓ Study area

- Poyang Lake
- Tian-E-Zhou s

✓ Method

- Captured survey
- Rescue in 200
- Life tables

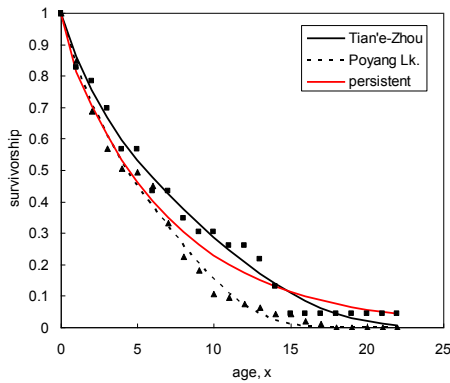

Satellite image of the Tian-E-Zhou oxbow

Institute of Hydrobiology, the Chinese Academy of Sciences

Q2: What affect?

➤ Adult survival rates: Poyang Lake < Tian'e Zhou

➤ r estimates:

Tian'e Zhou (**0.0355**, SD 0.0138)

Poyang Lake (-0.0485, SD = 0.0201)

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

Shortage of food resources

Degradation and Loss of Habitat

Direct Impacts

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

Compared life history parameters before and after 1993

	T_0	r
Pre93	8.96 (SD 0.430)	-0.0159 (SD 0.0135)
Post93	7.93 (SD 0.413)	-0.0625 (SD 0.0169)

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

Sex ratio of the historical population before and after 1993

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

Q3: Why so quickly?

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

◆ **Body conditions (H) are significantly different.**

✓ $H = \text{Weight (kg)} / \text{Body length (m)}$

◆ **Fish resource.**

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Q3: Why so quickly?

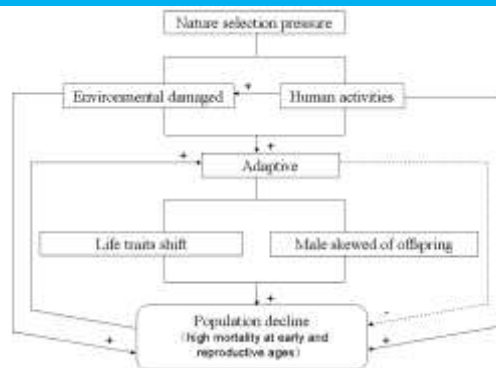

Figure. The hypothesis of the mechanism on the quick decline of YFP population. Where + means positive effect, - means negative effect; the hard line means the solid effect or we can call this long term effect, and the dashed line means the potential effect or short time effect.

中国科学院水生生物研究所 鲸类保护生物学学科组
Institute of Hydrobiology, the Chinese Academy of Sciences

Implications for the conservation

- Critically endangered on the IUCN red list.
- Accelerated population decline.
- Human activities affect the porpoise, and the *ex-situ* reserve is an effective management.
- The porpoise join the reproduction earlier and tend to give birth to more male babies which will cause further population decline.
- Shortage of fish resource has a strong responsibility to the male sex skew in babies.
