

# Conservation Ecology of Sharman's Rock Wallaby

---

Catherine Hayes

PhD Candidate

University of Queensland

**Supervised by:** Dr Diana Fisher and Professor  
Hugh Possingham, School of Biological Sciences;  
Dr John Kanowski, Australian Wildlife Conservancy

# Sharman's rock wallaby, *Petrogale sharmani*

- “Vulnerable” in Queensland
- Tiny geographic range
  - North Queensland tropical woodlands
  - Hoop pine growing on rock
  - 20 known colonies; 800-1000 individuals

# Sharman's rock wallaby

- Poor understanding of distribution and biology
- 4kg
- Invasive predator threats e.g. cats?
- Tropical mammal decline

# Research questions

- Australia's northern mammal decline
  - Recent decline of tropical mammals: fire-prone habitats
  - Interaction: fire and invasive predators/weeds
  - Protective function of rocky outcrops/small fires
- Collaboration between UQ and Australian Wildlife Conservancy
- Key questions
  - Distribution and demography
  - Effects of fire regime and invasive species
  - Management strategies

# Mount Zero Taravale

- Australian Wildlife Conservancy
- 80km north-west of Townsville
  - 73 ecosystems; 84 mammal species
- Home to 80% of known *P. sharmani* colonies

# Species distribution

- Survey Mt Zero Taravale/neighbouring properties
- Distribution and range limits in relation to topography and habitat features
- Boundary with neighbouring species – genetic tests
- Live trapping – folding cage traps
- Camera trapping
- Scats from rock ledges - DNA analysis

# Fire history and management

- How is distribution associated with fire history?
  - Mosaic of fire scars
- Mark-recapture population studies
  - Varying fire schedules
  - Birth/death rates
  - Survival of adults and juveniles

# Individual movements

- Habitat use and home range – topography and fire history
  - How far from outcrops?
  - Exposure to threats
- GPS data
- Camera trapping
- Extent and location of predation
  - Collection of feral dog, cat and fox scats
  - Gut contents from carcasses

# Research outcomes

- Distribution/demography
  - Improve understanding of conservation status
- Effects of varying fire regimes and introduced predators
  - Key threats; relative importance of threats
- Management strategies
  - Fire regimes
  - Predator control e.g. baiting
  - Preventing habitat degradation e.g. grazing off-reserve
- Australian tropical mammal declines - role of topography and fire regimes

# Acknowledgments

- Funding

- Queensland Government (Everyone's Environment research grant)
- Australian Wildlife Conservancy
